## Drug Tests (Strip/Card/Device/Cup)

AMP/BAR/BZO/BUP/COC/THC/MTD/mAMP/MDMA/MOP/OPI/OXY/PCP/PPX/TCA Available with Specimen Validity Tests (S.V.T.) for
Oxidants/PCC, Specific Gravity, pH, Nitrite, Glutaraldehyde and Creatinine One step, rapid screening tests for the qualitative detection of drug(s) and drug metabolite(s) in For forensic us
For forensic use only.
For in vitro diagnosi
For in vitro diagnosti
Drug Tests (Strip/Card/Device/Cup) is a lateral flow chromatographic immunoassay designed to qualitatively detect the presence of drugs and drug metabolites in human urine at the following cut-off concentrations:

| Test Name | Calibrator | Cut-off |
| :---: | :---: | :---: |
| Amphetamine/AMP 1000 | D-Amphetamine | $1000 \mathrm{ng} / \mathrm{mL}$ |
| Amphetamine/AMP 300 | D-Amphetamine | $300 \mathrm{ng} / \mathrm{mL}$ |
| Barbiturates/BAR | Secobarbital | $300 \mathrm{ng} / \mathrm{mL}$ |
| Benzodiazepines/BZO | Oxazepam | $300 \mathrm{ng} / \mathrm{mL}$ |
| Buprenorphine/BUP | Buprenorphine | $10 \mathrm{ng} / \mathrm{mL}$ |
| Cocaine/COC 300 | Benzoylecgonine | $300 \mathrm{ng} / \mathrm{mL}$ |
| Cocaine/COC 150 | Benzoylecgonine | $150 \mathrm{ng} / \mathrm{mL}$ |
| Marijuana/THC | Delta-9-THC-COOH | $50 \mathrm{ng} / \mathrm{mL}$ |
| Methadone/MTD | Methadone | $300 \mathrm{ng} / \mathrm{mL}$ |
| Methamphetamines/mAMP 1000/MET 1000 | D-Methamphetamine | $1000 \mathrm{ng} / \mathrm{mL}$ |
| Methamphetamines/mAMP 500/MET 500 | D-Methamphetamine | $500 \mathrm{ng} / \mathrm{mL}$ |
| Methylenedioxymethamphetamine/MDMA | MDMA | $500 \mathrm{ng} / \mathrm{mL}$ |
| Opiates 300/MOP/OPI 300 | Morphine | $300 \mathrm{ng} / \mathrm{mL}$ |
| Opiates 2000/OPI 2000 | Morphine | $2000 \mathrm{ng} / \mathrm{mL}$ |
| Oxycodone/OXY | Oxycodone | $100 \mathrm{ng} / \mathrm{mL}$ |
| Phencyclidine/PCP | Phencyclidine | $25 \mathrm{ng} / \mathrm{mL}$ |
| Propoxyphene/PPX | Propoxyphene | $300 \mathrm{ng} / \mathrm{mL}$ |
| Tricyclic Antidepressants/TCA | Nortriptyline | $1000 \mathrm{ng} / \mathrm{mL}$ |

Drug Tests (Strip/Card/Device/Cup) provides only a preliminary analytical test result. metest must be used in order to confirm the test result Gas Chromatography/Mas Spectrometry (GC/MS) is the preferred confirmatory method. Clinical consideration and professional judgment should be applied to any drug of abuse test results, particularly when preliminary positive results are obtained.
SUMMARY AND EXPLANATION OF THE TEST
Drug Tests (Strip/Card/Device/Cup) is an easy, fast, qualitative, visually read competitive binding immunoassay method for screening specific drugs and the metabolites without the need of instrumentation. The method employs a unique mixture o antibodies to selectively detect the elevated levels of specific drugs and their metabolite in urine. Drug Tests (Strip/Card/Device/Cup) optionally includes an adulteration strip AMPHETAMINE / AMP 1000
Amphetamines are central nervous system stimulants that produce alertness, wakefulness, increased energy, reduced hunger, and overall feeling of well-being. They are chemically related to the human body's natural catecholamines: epinephrine and norepinephrine Large doses and extended usage can result in higher tolerance levels and physiologica dependency leading to substance abuse. The effect of Amphetamines generally last 2-4 hours following use, and the drug has a half-life of 4-24 hours in the body. About $30 \%$ of Amphetamines are excreted in the urine in unchanged form, with the remainder as hydroxylated and deaminated derivatives. Drug Tests (Strip/Card/Device/Cup) yields a positive result when Amphetamines in urine exceed 1000 ng mL, which is the suggested Service Adminitrat posive specim USA). AMPHETAMINE / AMP 300
Drug Tests (Strip/Card/Device/Cup) yields a positive result when Amphetamines in drug exsts (Strip/Card/Device/Cup) yields a positive result when A

## BARBITURATES / BAR

Barbiturates are central nervous system depressants. They are usually administered orally but are sometimes injected intramuscularly and intravenously. Barbiturates range from short-acting (approximately 15 minutes, such as secobarbital) to long-acting ( 24 hours or longer, such as Phenobarbital). Short-acting barbiturates are extensively metabolized in the body, while the long-acting ones are secreted primarily unchanged. Barbiturate of well being. Large doses of Barbiturate could develop tolerance and physiological dependency and lead to its abuse. Drus Tests (Strip/Card/Device/Cup) yields a positive result when secobarbital in urine exceeds $300 \mathrm{ng} / \mathrm{mL}$.

## EENZODIAZEPINES / BZO

Benzodiazepines are a class of drugs that are often therapeutically used as anxiolytics, anti-convulsants and sedative hypnotics. Benzodiazepines manifest their presence by respiratory depression, blockade of adrenocortical response, and a decrease in peripher resistance without an impact on the cardiac index. The major pathways of elimination ar the kidneys (urine) and the liver where it is conjugated to glucuronic acid. Large doses of Benzodiazepines could develop tolerances and physiological dependency and lead to its abuse. Only trace amounts (less than 1\%) of Benzodiazepines are excreted unaltered in the arine, most of Benzodiazepines in urine is conjugated drug. Oxazepam, a common metabolite of many benzodiazepines, remains detectable in urine for up to one week, which makes Oxazepam a useful marker of Benzodiazepines abuse. Drug Tests Strip/Card/Device/Cup) yields a positive result when oxazepam in urine exceeds 300 BUPRE
Buprenorphine is a potent analgesic often used in the treatment of opioid addiction. The drug is sold under the trade names Subutex $\mathrm{x}^{\mathrm{TM}}$, Buprenex $\mathrm{x}^{\mathrm{TM}}$, Temgesic ${ }^{\mathrm{TM}}$ and Suboxone ${ }^{\mathrm{TM}}$, which contain Buprenorphine HCl alone or in combination with Naloxone HCl. Therapeutically, Buprenorphine is used as a substitution treatment for opioid addicts. Substitution treatment is a form of medical care offered to opiate addicts (primarily heroin addicts) based on a similar or identical substance to the drug normally used. In substitution herapy, Buprenorphine is as effective as Methadone but demonstrates a lower level of physical dependence. Concentrations of free Buprenorphine and Norbuprenorphine in $\mathrm{ng} / \mathrm{ml}$ in abuse situations. The plasma half life of Buprenorphine is $2-4$ hours. While complete elimination of a single dose of the drug can take as long as 6 days, the window of detection for the parent drug in urine is thought to be approximately 3 days. Drug Tests Strip/Card/Device/Cup) yields a positive result when Buprenorphine in urine exceeds $10 \mathrm{ng} / \mathrm{mL}$.
COCAINE / COC 300
Cocaine is an alkaloid present in Coca leaves (Erythyroxine coca). Its pharmacological properties, such as stimulating and euphoric effects, have been known for centuries Cocaine produces alertness, wakefulness, increased energy, reduced hunger, and an overall feeling of well being. In large dose, Cocaine causes fever, unresponsiveness, difficulty in breathing and unconsciousness. Cocaine is often self-administered by nasal primarily as Benzoylecgonine, which can generally be detected for $24-48$ hours afte cocaine exposure. Drug Tests (Strip/Card/Device/Cup) yields a positive result when the cocaine exposure. Drug Tests (Strip/Card/Device/Cup) yields a positive result when the for positive specimens set by the Substance Abuse and Mental Health Service Administration (SAMHSA, USA).
COCAINE / COC 150
Drug Tests (Strip/Card/Device/Cup) yields a positive result when the Cocaine metabolite in urine exceeds $150 \mathrm{ng} / \mathrm{mL}$. See COCAINE / COC 300 for summary MARIJUANA / THC
THC ( $\Delta^{9}$ - tetrahydrocannabinol) is the primary active ingredient in cannabis (marijuana) THC is central nervous stimulant that alters mood and sensory perceptions, produces loss of coordination, impairs short-term memory, produces symptoms of anxiety, paranoia, depression, confusion, hallucination, and increases heart rate. Large doses of marijuana metabolite excreted in the urine isiological dependency and lead its abuse. The mai ( $\Delta^{9}-\mathrm{THC}-\mathrm{COOH}$ ), which is found in 11 -nor- $\Delta^{9}$ - tetrahydrocannabinol-9-carboxylic acid detectable for 3-10 days after smoking. Drug Tests (Strip/Card/Device/Cup) yields positive result when the concentration of THC -COOH in urine exceeds $50 \mathrm{ng} / \mathrm{mL}$, which is the suggested screening cut-off for positive specimens set by the Substance Abuse and Mental Health Service Administration (SAMHSA, USA)

## METHADONE / MTD

Methadone is a narcotic analgesic prescribed for the management of moderate to severe pain and for the treatment of opiate dependence (Heroin, Vicodin, Percocet, Morphine). It
is administered either orally, or by intravenous or intra-muscular injection. The duration of ffect of methadone is $12-24$ hours. Its major urinary excretion products are methadone, EDDP (2-ethylidene-1,5-dimethyl-3,3-diphenylprryolidine), and EMDP (2- ethyl-5-meth 3, 3-diphenylpyrrolidine). Drug Tests (Strip/Card/Device/Cup) yields a positive result when the concentration of Methadone in urine exceeds $300 \mathrm{ng} / \mathrm{mL}$.
METHAMPHETAMINES / mAMP 1000 / MET 1000
Methamphetamine is an addictive stimulant drug that strongly activates certain systems in the brain. Methamphetamine is closely related chemically to amphetamine, but the central nervous system effects of methamphetamine are greater. Methamphetamine can be taken
orally, injected, or inhale. Acute higher doses lead to enhanced stimulation of the central nervous system and induce euphoria, alertness, reduced appetite, and a sense of increas energy and power. Methamphetamine is excreted in the urine as amphetamine and
xidized and deaminated derivatives. However, 10 to $20 \%$ of Methamphetamine is excreted unchanged. Thus, the presence of the parent compound in the urine indicates Methanphetamine use. Drug T St Cable $1000 \mathrm{ng} / \mathrm{mL}$ METHAMPHETAMINES / mAMP 500 / MET 500
Drug Tests (Strip/Card/Device/Cup) yields a positive result when the concentration of Methamphetamine in urine exceeds $500 \mathrm{ng} / \mathrm{mL}$. See METHAMPHETAMINE / mAMP 000 for summary.

## METHYLENEDIOXYMETHAMPHETAMINE / MDMA

MDMA belongs to a family of man-made drugs. Its relatives include MDA (methylenedioxyamphetamine), and MDEA (methylenedioxyethylamphetamine). They all share the amphetamine-like effects. MDMA is a stimulant with hallucinogenic tendencies described as an empathogen as it releases mood-altering chemicals, such as cartooning and
L-dopa, and may generate feelings of love and friendliness. The adverse effects of MDMA use include elevated blood pressure, hyperthermia, anxiety, paranoia and insomnia. MDMA is administered either by oral ingestion or intravenous injection. The effects of MDMA begin 30 minutes after intake, peak in an hour and last for $2-3$ hours. Drug Tests (Strip/Card/Device/Cup) yields a positive result when the concentration of MDMA in urine exceeds $500 \mathrm{ng} / \mathrm{mL}$.
OPIATES 300 / MOP / OPI 300
Opiates refer to any drug that is derived from the opium poppy, including the natural products, morphine and codeine, and the semi-synthetic drugs such as heroin. Opiates exert their effects on the central nervous system and organs containing smooth muscle.
Opiates manifest their presence by analgesia, drowsiness, euphoria, lowering of body temperature, respiratory depression, blockade of adrenocortical response. The major pathways of elimination are kidneys (urine) and the liver where it is conjugated to glucuronic acid. Opiates and their metabolites can be detected in urine as result of heroin, morphine, codeine or poppy seed intake. Drug Tests (Strip/Card/Device/Cup) yields a positive result when the concentration of Opiates in urine exceeds $300 \mathrm{ng} / \mathrm{mL}$.

## OPIATES 2000 / OPI 2000

Drug Tests (Strip/Card/Device/Cup) yields a positive result when the concentration of Opiates in urine exceeds $2000 \mathrm{ng} / \mathrm{mL}$, which is the suggested screening cut-off for ositive specimens set by the Substance Abuse and Mental Health Service Administration (SAMHSA, USA). See
OXYCODONE / OXY
Oxycodone is an analgesic, which works by depressing the central nervous system. Oxycodone is abused for its opiate-like effects. In addition to its equal potency to
morphine in analgesic effects, it is also equipotent to morphine in relieving abstinence ymptoms from chronic opiate (heroin, morphine) use. For this reason, it is often used to alleviate or prevent the onset of opiate withdrawal by street users of heroin and methadone. The drug is most often administered orally. Like other opiates, Oxycodone can also depress the respiratory system resulting in suffocation and death when overdosed. Oxycodone is very addictive, both physically and psychologically. Some physical indications of Oxycodone abuse include extreme loss of appetite and weight, cramps, nausea, vomiting, excessive scratching and complaint of itching, excessive sweating,
constipation, pin-point pupils and watery eyes, reduced vision, drowsiness, euphoria, trance-like states, excessive thirst, tremors, twitching irritability, hallucinations and ethargy. Drug Tests (Strip/Card/Device/Cup) yields a positive result when the concentration of Oxycodone in urine exceeds $100 \mathrm{ng} / \mathrm{mL}$.

## PHENCYCLIDINE / PCP

Phencyclidine, commonly known as PCP or "angel dust" is used primarily as recreational rug due to its hallucinogenic effects. It is generally self-administered by intravenous jection or by inhalation and concentrates fastest in fatty tissues and the brain. The effects of PCP are very much dose related. Small amounts of Phencyclidines (PCP) are central nervous system stimulants that produce alertness, wakefulness, increased energy, being. Large doses of Phencyclidine (PCP) can result in death due to convulsions, heart and lung failure and coma Large repeated doses of Phencyclidine (PCP) could develop tolerances and physiological dependency and lead to its abuse. PCP can be found in urine within 4 to 6 hours after use and will remain in urine for 7 to 14 days. Phencyclidine is xcreted in the urine as an unchanged drug ( $4 \%$ to $19 \%$ ) and conjugated metabolites ( $25 \%$ o 30\%). Drug Tests (Strip/Card/Device/Cup) yields a positive result when the oncentration of Phencyciidine in urine exceeds $25 \mathrm{ng} / \mathrm{mL}$, which is the suggested screening cut-off for positive specimens set by the Substance Abuse and Mental Health Service Administration (SAMHSA, USA).
ROPOXYPHENE / PPX
ropoxyphene is a prescription drug for the relief of pain. Overdose of propoxyphene can have the symptoms including analgesia, stupor, respiratory depression and coma. The
half-life of propoxyphene is 8 to 24 hours. Propoxyphene reaches its peak in 1 to 2 hours after oral administration. Drug Tests (Strip/Card/Device/Cup) yields a positive result when the concentration of propoxyphene level in urine exceeds $300 \mathrm{ng} / \mathrm{mL}$.

## TRICYCLIC ANTIDEPRESSANTS / TCA

Tricyclic Antidepressants are a group of antidepressant drugs that are commonly used fo treatment of depressive disorders. TCAs can be taken orally or by intramuscularly
injection (IM). The symptoms of TCAs overdoses include hallucinations, hypertonicity, seizures, and EKG changes. The half-life of TCA varie from a few hours to several days. The commonly used TCAs are excreted with a very low percentage of unchanged drugs in the urine. Therefore, detection of the metabolites of TCAs in human urine has been used for screening the abuse of TCAs. Drug Test (Strip/Card/Device/Cup) yields a positive result when the concentration of Nortriptylin in urine exceeds $1,000 \mathrm{ng} / \mathrm{mL}$

## S.V.T. SUMMARY

The strips contain chemically treated reagent pads. Three to five minutes following th activation of the reagent pads by the urine sample, the colors that appear on the pads can
be compared with the printed color chart card. The color comparison provides semi-quantitative screen for any combination of oxidants/pyridinium chlorochromate (PCC), specific gravity, pH , nitrite, glutaraldehyde and creatinine in human urine which can help to assess the integrity of the urine sample.

## WHAT IS ADULTERATION?

Adulteration is the tampering of a urine specimen with the intention of altering the test results. The use of adulterants can cause false negative results in drug tests by either interfering with the screening test and/or destroying the drugs present in the urine Dilution may also be employed in an attempt to produce false negative drug test results. characteristics such as pH , specific gravity and creatinine and to detect the presence of oxidants/PCC, nitrites or glutaraldehyde in urine

- Oxidants/PCC (Pyridinium chlorochromate) tests for the presence of oxidizing agents such as bleach and hydrogen peroxide. Pyridinium chlorochromate (sold under the brand name UrineLuck) is a commonly used adulterant. ${ }^{6}$ Normal human urine should no contain oxidants of PCC.
Specific gravity tests for sample dilution. The normal range is from 1.003 to 1.030 Values outside this range may be the result of specimen dilution or adulteration.
- $\mathbf{p H}$ tests for the presence of acidic or alkaline adulterants in urine. Normal pH levels should be in the range of 4.0 to 9.0 . Values outside of this range may indicate the sample has been altered.

Nitrite tests for commonly used commercial adulterants such as Klear and Whizzies. They work by oxidizing the major cannabinoid metabolite THC-COOH. ${ }^{9}$ Normal urin should contain no trace of nitrite. Positive results generally indicate the presence of an adulterant.

- Glutaraldehyde tests for the presence of an aldehyde. Adulterants such as UrinAid an Clear Choice contain glutaraldehyde which may cause false negative results by disrupting urin: therefore detection of glutaraldehyde in a urine specimen is generally an indicato of adulteration.
- Creatinine is a waste product of creatine; an amino-acid contained in muscle tissue and found in urine. ${ }^{8}$ A person may attempt to foil a test by drinking excessive amounts of water or diuretics such as herbal teas to "flush" the system. Creatinine and specific gravity are two ways to check for dilution and flushing, which are the most common mechanisms used in an attempt to circumvent drug testing. Low Creatinine and specific gravity level may indicate dilute urine. The absence of Creatinine ( $<5 \mathrm{mg} / \mathrm{dl}$ ) is indicative of specimen not consistent with human urine
Drug Tests (Strip/Card/Device/Cup) is a competitive binding immunoassay in which frugs limited labeled antibody binding sites. When a sufficient amount of urine specimen is applied to the sample pad of the test device, the urine specimen migrates through the tes device by capillary action. If the drug or drug metabolite concentration in the specimen is below the cut-off level, the anti-drug antibodies in colloidal gold particles will bind to the drug antigens coated in the test line of the nitrocellulose membrane to form a T line, which indicates a negative result. If the concentration of drug in the urine specimen is above the cut-off level, it will bind with antibodies conjugated with colloidal gold particles, so that no T line will be developed in the test region, which indicates a positive result.

## REAGENTS

Drug Tests (Strip/Card/Device/Cup) contains membrane strips coated with drug-protei conjugates (purified bovine albumin) on the T zone, goat polyclonal antibody against erotein conjugate at the C zone, and a dye pad which contains colloidal gold particles coated with mouse monoclonal antibodies specific against to Amphetamine, Barbiturates Benzodiazepines, Buprenorphine, Cocaine, Marijuana, Methadone, Methamphetamine Methylenedioxymethamphetamine, Morphine, Oxycodone, Phencyclidine, Propoxy phene and Tricyclic Antidepressants.
S.V.T. REAGENTS

| Adulteration Pad | Reactive indicator | Buffers and non-reactive ingredients |
| :--- | :---: | :---: |
| Oxidants / PCC | $0.36 \%$ | $99.64 \%$ |
| Specific Gravity | $0.25 \%$ | $99.75 \%$ |
| pH | $0.06 \%$ | $999 \%$ |
| Nitrite | $0.07 \%$ | $99.93 \%$ |
| Glutaraldehyde | $0.02 \%$ | $99.98 \%$ |
| Creatinine | $0.04 \%$ | $99.96 \%$ |

## MATERIALS REQUIRED BUT NOT PROVIDED

## Clock or timer

PRECAUTIONS
2. For in vitro diagnostic use only.
3. Do not use after the expiration date.
4. The drug tests should remain in the sealed pouch until use
5. All specimens should be considered potentially hazardous and handle in the same way as an infectious material.
6. All used drug tests should be discarded according to federal, state and local regulation. SORAGE AND STABILITY
Store Drug Tests (Strip/Card/Device/Cup) in the sealed pouch at $2^{\circ} \mathrm{C}$ to $30^{\circ} \mathrm{C}$. The drug remain in the sealed pouch until use. If store $a^{\circ} 2^{\circ} \mathrm{C}$ to $8^{\circ} \mathrm{C}$, allow the drug tests to reach rom $\left(15^{\circ} \mathrm{C}\right.$ to $\left.30^{\circ} \mathrm{C}\right)$ bere performing the test Dot not freeze, do not use room temperature ( $15^{\circ} \mathrm{C}$ to SPECIMEN COLIECT
Fresh urine specimens should be collected directly into a clean and dry container. Urine collected at any time of the day may be used for testing. Urine specimen exhibiting visible precipitates should be centrifuged, filtered or allowed the precipitates to settle to obtain a clear specimen for testing.
For best results, test a fresh specimen immediately following collection. Storage of specimens should not exceed 2 hours at room temperature or 4 hours refrigerated $\left(2-8^{\circ} \mathrm{C}\right)$ prior to using.

## For Drug Test Strip:

For Drug Test Strip:

1. Equiliorate the test strip, urine specimens or external controls to room temperature (15 prior to testing
2. Remove the test strip from the sealed pouch and dip the end of the strip into the strip just below least 15 seconds to 20 seconds or until migration occurs. Immerse the stip just below the top line of the wave line on the test strips.
. Face the test strip on a flat dry surface
3. Read the results at 5 to 10 minutes.

For Drug Test Card:

1. Equilibrate the test card, urine specimens or external controls to room temperature (15 $-30^{\circ} \mathrm{C}$ ) prior to testing.
2. Remove the test card from the sealed pouch and dip the card into the specimen for at least 15 seconds to 20 seconds or until migration occurs. Immerse the strip (s) of the test card just below the top line of the wave line on the test strips; do not dip the card above
he top line.
Place the test card on a flat dry surface
Read the adulteration strips between 3 to 5 minutes (when applicable) by comparing the colors in the adulteration pads to the enclosed color chart. If the specimen indicates adulteration, refer to your Drug Free Policy for guidelines on adultered specimens. We recommend not to interpret the drug test results and suggest you to retest the urine by using another specimen.
3. Read the results at 5 to 10 minutes.

For Drug Test Device:
Allow the test device, urine specimen, and/or controls to equilibrate to room emperature $\left(15-30^{\circ} \mathrm{C}\right)$ prior to testing.
. Bring the pouch to room temperature before opening it. Remove the test device from the sealed . Place the test device on a clean and level surface. Hold the dropper vertically and transfer 3 full drops of urine (approx. $100 \mu \mathrm{~L}$ ) to the specimen well (S) of the test device, and then start the mer. Avoid trapping air bubbles in the specimen well (S). See the illustration below.
, 5 mit is importan hat the background is clear before the result is read. Do not interpret the result after 10 minutes.

For Drug Test Cup:
Allow the cup, urine specimen, and/or controls to reach room temperature ( $15-30^{\circ} \mathrm{C}$ ) before testing.

1. Remove the cup from the sealed pouch and use it as soon as possible.
. Collect specimen in the cup and secure the cap tightly.
2. If the temperature strip is included with Drug Test Cup, please read urine temperature between 2-4 minutes after voiding to verify the temperature ranges between $90-100^{\circ} \mathrm{F}$ $\left(33-38^{\circ} \mathrm{C}\right.$ ).
3. Place the cup on a flat surface.
. Date and initial the security seal, and place the security seal on the cap
. Peel off the label on the cup to view the results.
to 5 minuteration test is included on the test cup, read the adulteration test results between
2 to
mine we recommend not to interpret the drug test results and either retest the urine or collect another specimen.

## 

##  <br> fll minllinilin

INTERPRETATION OF RESULTS
Positive: One colored line appears in the Control zone (C). No line appears in the Test Zone ( $\mathbf{T}$ ). The absence of a line in the test region ( T line) indicates a positive resul. The positive result indicates that the drug level is above the detectable level. Note: The samples with positive results should be confirmed with more specific method. appears in the Test zone. The negative result indicates the drug or its metabolite level is appears in the Test zone. Invalid: No line appears in the Control zone. If no C line or no C line and T line develop within 5 to 10 minutes, the test is invalid. The test should be repeated with a new test device. Insufficient specimen volume or the incorrect procedural techniques are the most likely reasons for invalid result. Review the procedure and repeat the test using a
new test strip or device. If the problem persists, discontinue using the current lot and contact your suppliers.
(Please refer to the colo
Semi-quantitative results are obtained by visually comparing the reacted color blocks on the strip to the printed color blocks on the color chart. No instrumentation is required. QUALITY CONTROL

1. Built-in Control: the test contains a built-in control feature, the C line. The presence of the C line indicates that the test is performed properly. If a C line does not form, the test is considered invalid. In this case, the testing should be repeated with a new drug tests. 2. External Quality Control: Control materials are not supplied with this kit. However, it is recommended that positive and negative controls should be tested as good laboratory practice to confirm the test procedure and to verify proper test performance.
negative), with each new untrained operator, monthly for storage, and (positive and negative), with each new untrained operator, monthly for storage, and as otherwise S.V.T. ADULTERATIONS LIMITATIONS
2. The adulteration tests included with the product are meant to aid in the determination of abnormal specimens. While comprehensive, these tests are not meant to be an "all-inclusive" representation of possible adulterants.
3. Oxidants/PCC: Normal human urine should not contain oxidants or PCC. The presence of high levels of antioxidants in the specimen, such as ascorbic acid, may result in false negative results for the oxidants/PCC pad.
4. Specific Gravity: Elevated levels of protein in urine may cause abnormally high specific gravity values.
5. pH tests for the presence of acidic or alkaline adulterants in urine. Normal pH levels has been altered.
6. Nitrite: Nitrite is not a normal component of human urine. However, nitrite found in urine may indicate urinary tract infections or bacterial infections. Nitrite levels of > 20 mg /dL may produce false positive glutaraldehyde results.
7. Glutaraldehyde: is not normally found in urine. However certain metabolic abnormalities such as ketoacidosis (fasting, uncontrolled diabetes or high protein diets) may interfere with the test results.
8. Creatinine: Normal Creatinine levels are between 20 and $350 \mathrm{mg} / \mathrm{dL}$. Under rare conditions, certain kidney diseases may show dilute urine
9. Drug Tests (Strip/Card/Device/Cup) provides only a qualitative, preliminary testing result. A more specific testing method must be used in order to obtain a confirmed testing result. Gas Chromatography/Mass Spectrometry (GC/MS) is the preferred confirmatory method.
10. There is a possibility that technical or procedural errors, as well as other interfering substances in the urine specimen may cause erroneous results.
11. Adulterants such as bleach or other oxidizing agents may produce erroneous results. If suspected, the test should be repeated with a fresh specimen and a new drug tests.
. The urine specimens with bacterial contamination should not be used for testing, as these contaminations may interfere with the test and cause false results
administration or the concentration of the drug in the urine. 6. A negative result may not necessarily indicate drug-free
obtained when drug is present but below the cut-off level of test.
12. Test does not distinguish between drugs of abuse and certain medications.
13. Certain foods or food supplements may cause a false positive result.

PERFORMANCE CHARACTERISTICS

## Accuracy:

The comparison studies were conducted using Drug Tests (Strip/Card/Device/Cup) and commercially available rapid drugs of abuse tests. The studies were performed on settings. Presumptive positive results were confirmed by GC/MS. The following results are summarized from these comparison studies:

## ensitivity:

Sensitivity of Drug Tests (Strip/Card/Device/Cup) was characterized by validating the test performance around the claimed cut-off concentration of each test. The cut-off of each test was determined by the lowest concentration of drug which produces at least $50 \%$ positive testing results in total numbers of determinations. The results were summarized as the following:

| Based on above data, sensitivity of the assay to the 18 analytes is as follows: |  |  |  |
| :---: | :---: | :---: | :---: |
| Amphetamine 1000: | $1000 \mathrm{ng} / \mathrm{mL}$ | Methamphetamine 1000: | $1000 \mathrm{ng} / \mathrm{mL}$ |
| Amphetamine 300: | $300 \mathrm{ng} / \mathrm{mL}$ | Methamphetamine 500: | $500 \mathrm{ng} / \mathrm{mL}$ |
| Barbiturates: | $300 \mathrm{ng} / \mathrm{mL}$ | MDMA: | $500 \mathrm{ng} / \mathrm{mL}$ |
| Benzodiazepines: | $300 \mathrm{ng} / \mathrm{mL}$ | Opiates 300: | $300 \mathrm{ng} / \mathrm{mL}$ |
| Buprenorphine: | $10 \mathrm{ng} / \mathrm{mL}$ | Opiates 2000: | $2000 \mathrm{ng} / \mathrm{mL}$ |
| Cocaine 300: | $300 \mathrm{ng} / \mathrm{mL}$ | Oxycodone: | $100 \mathrm{ng} / \mathrm{mL}$ |
| Cocaine 150: | $150 \mathrm{ng} / \mathrm{mL}$ | Phencyclidine: | $25 \mathrm{ng} / \mathrm{mL}$ |
| Marijuana: | $50 \mathrm{ng} / \mathrm{mL}$ | Propoxyphene: | $300 \mathrm{ng} / \mathrm{mL}$ |
| Methadone: | $300 \mathrm{ng} / \mathrm{mL}$ | Tricyclic Antidepressants: | $1000 \mathrm{ng} / \mathrm{mL}$ |

Precision/Reproducibility:
Reproducibility was determined by replicating tests on five different concentrations of each drug in urine specimens: negative, $50 \%$ below cut-off, $25 \%$ below cut-off, $25 \%$
above cut-off and $50 \%$ above cut- off. Each drug test was tested four times daily for five consecutive days with a total 20 assays at each concentration. The data are summarized below:

The data presented here demonstrates excellent precision/ reproducibility of Drug Tests (Strip/Card/Device/Cup) across multiple concentrations of human urine
Analytical Specificity:
Cross-reactivity was established by spiking various concentrations of similarly structured drug compounds into drug-free urine /a negative control. Analyzing various concentration
of each compound by using Drug Tests (Strip/Card/Device/Cup), the concentration of of each compound by using Drug Tests (Strip/Card/Device/Cup), the concentration of
the drug that produced a response approximately equivalent to the cut-off concentration of the assay was determined. Results of those studies appear in the table(s) below:

| Drug Compound | Response equivalent to cutoff in $\mathrm{ng} / \mathrm{mL}$ |
| :---: | :---: |

Interfering Compounds:
The following compounds in both drug-free urine and drug positive urines with Amphetamine, Barbiturate, Benzodiazepine, Buprenorphine, Cocaine, Marijuana Methadone, Methamphetamines, Mehtylenedioxymethamphetamine, Opiates, Oxycodone

Phencyclidine, Propoxyphene, Tricyclic Antidepressants show no cross-reactivity when tested with Drug Tests (Strip/Card/Device/Cup) at a concentration of $100 \mu \mathrm{~g} / \mathrm{mL}$

Biological Materials:

## Albumin

 Uric Am-Ascorbic Acid)Creatine
Hemoglobin
Glucose
(There is a possibility that other substances and/or factors not listed above may interfere with the test and cause false results.)
